Proposal for Improvements and Opportunity Areas – Radar UrbiNexus (MVP)

User Experience and Visual Design (UI/UX)

- **Corporate Branding and Identity:**
  - Visible inclusion of the company's official logo in the dashboard header and navigation bar.
  - Application of the official corporate color palette to keep consistency with the brand.
- **Dark Theme Support (Dark Mode):**
  - Option to switch to a dark ("black style") interface to reduce eye strain during long monitoring sessions and to adapt to the operators' preferences.
- **Dashboard Personalization:**
  - Allow the user to rearrange or customize the monitoring widgets according to the relevance of their daily activities.

Security, Access Control and User Management

- **Role and Permission Assignment (RBAC):**
  - Implementation of a granular permission scheme (e.g., Super Admin, Infrastructure Administrator, QA Operator, Reader/Auditor) to prevent all users from accessing with administrator privileges.
- **Single Sign-On (SSO) and 2FA:**
  - Integration of two-factor authentication (MFA) and compatibility with identity providers (SAML/OAuth/Google Workspace).
- **Activity Auditing:**
  - Recording of system actions (Audit Logs) to track which user made configuration changes or queried sensitive information.

Log Management and Monitoring Features

- **Advanced Filters and Real-Time Search:**
  - Implementation of dynamic filters by severity level (ERROR, WARN, INFO, DEBUG), source server (QA, Main, Payment) and date/time range.
  - Search by keywords or regular expressions in the log stream.
- **Export and Reports:**
  - Function to download log excerpts or consolidated reports in CSV, JSON or PDF formats.
- **Automatic Alerts and Notifications:**
  - Configuration of real-time alert rules connected to channels such as email, Slack or Microsoft Teams when critical failures or service outages are detected.

Chatbot (AI) Optimization and Evaluation

- **Response Evaluation and Feedback:**
  - Addition of feedback controls ("like" / "dislike") on the chatbot responses to measure the accuracy and usefulness of the Amazon Bedrock (Nova Lite) model.

- **Conversation History:**
    - Storage and retrieval of previous chat sessions to give continuity to earlier incidents or queries.
- **Response Time and Latency Monitoring:**
    - Visible metric of the time the AI takes to process and interpret the data before responding to the user.

Performance and Infrastructure Metrics (KPIs)

- **Service Status Panel (Health Check):**
    - Real-time visual indicators of the health and availability (uptime) of the QA, Main and Payment servers.
- **Load and Performance Measurement:**
    - Stress tests to ensure the interface keeps its visual fluidity during high-traffic events or massive log generation.
- **Traceability and Task Control:**
    - Verification of the complete sequence of deliverables (such as the clarification/follow-up of task T04) to ensure 100% coverage of the roadmap.

Conclusion and Next Steps

The current prototype lays an excellent technical foundation.
The gradual incorporation of these improvement areas will make it possible to turn the tool into a complete, secure, intuitive control center that is ready to scale to production.
